

2026

KEEP IT GOING BEYOND

Revolution by AI we are experiencing is truly shocking. AI also opened a new door to develop the table tennis equipment, especially in the rubber R&D. BEYOND is a new brand philosophy aligned with this new digital paradigm. Moving to the brave new world from old habits BEYOND directs our future to make more innovative and creative products for table tennis. Future of XIOM will continuously bring unimaginable progress in the table tennis industry.

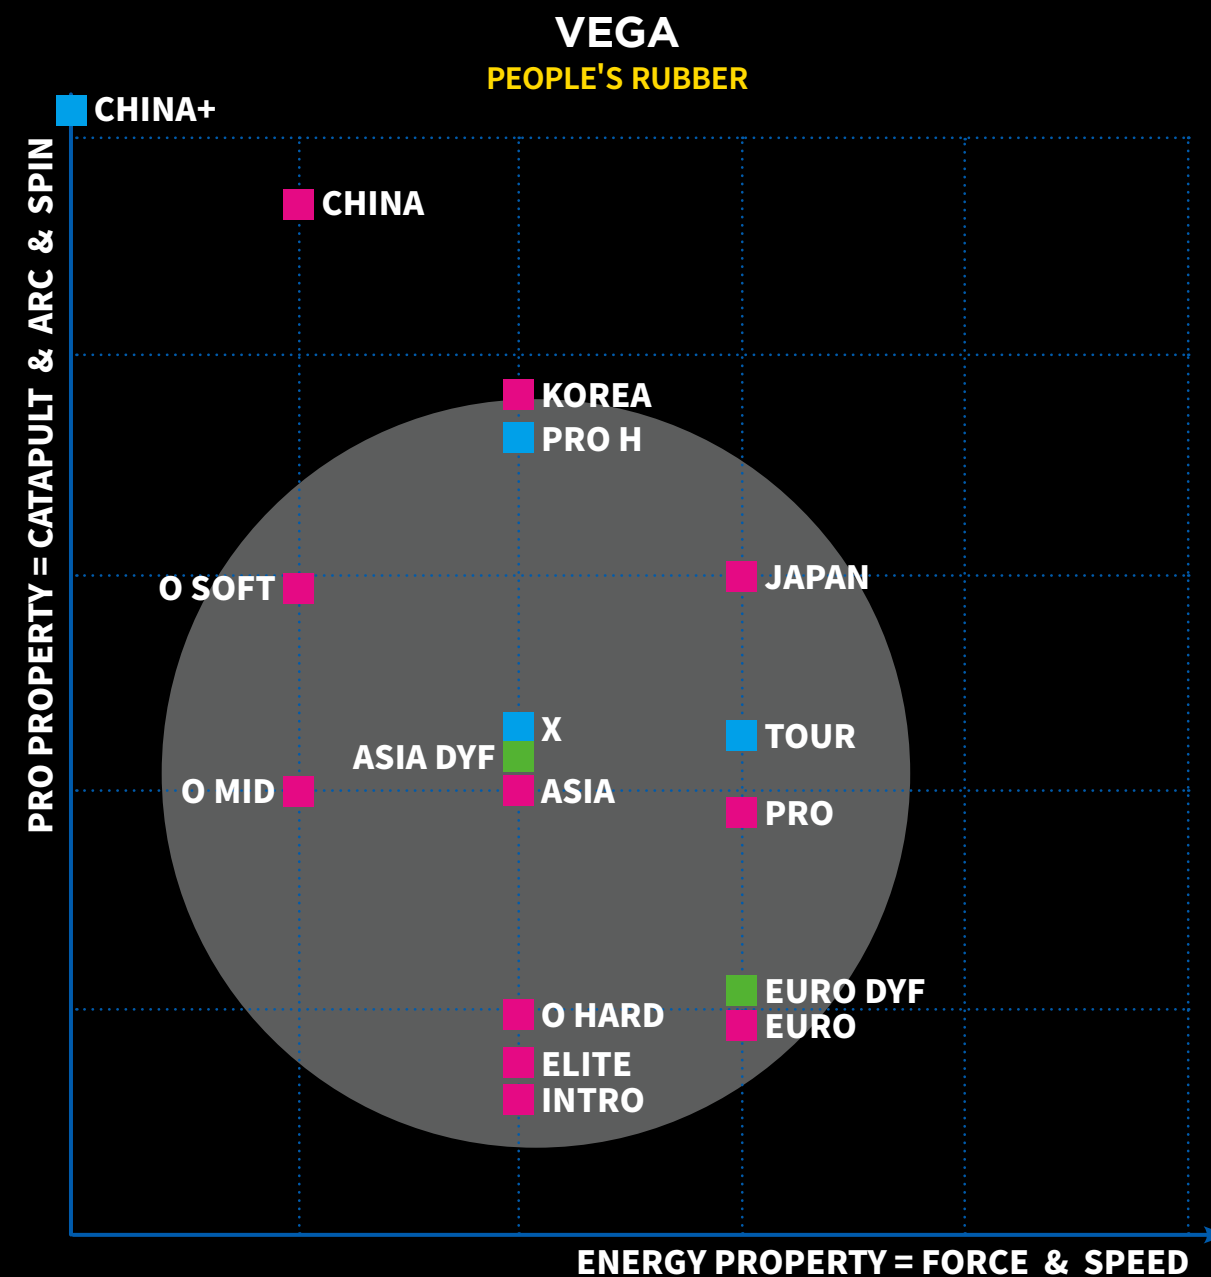

CYCLOID ON DEEP LEARNING

CYCLOID technology employing Deep Learning analyzes a big data. Not only to reduce the number of balls hitting the net or going over the end line, CYCLOID strategically creates the optimal Spin-to-Distance ratio. More balls touch the end line thanks to the mechanism of CYCLOID. New ratio enhanced the ball velocity via new energy dynamics.

SNOW-TIRE GRIP ON SURFACE

Key to generate stronger spin is mostly from the friction between the ball and the rubber at the point of both-moving contact so called DYNAMIC FRICTION. But the aggressive spin needs accurate and powerful swing. DYNAMIC FRICTION technology allows more tolerance for spin accuracy. This innovation inspired by snow tire technology.

BLACK SPONGE = POWER ENGINE

CARBO SPONGE is distinguished by a strong black color as it contains the carbon to make higher energy efficiency. CARBO SPONGE makes the catapult effect with less energy loss and boosts the spin and speed. Think of the sponge as an engine and the top sheet as the steering mechanism. Experience powerful 「Black Engine」!!

BIG WINDOW

Window refers to the space above net that a ball must pass through in order to land safely in the opponent's court. HYPER ELASTO technology enlarges this window makes the ball to pass the net higher and land safely on the opponent's court. BIG WINDOW effect increases the overall statistical success rate in drive attacks.

C 52.5

	52.5	2.1	RED BLK	79-085

CLASSIC STICKY
Over 60 Sponge

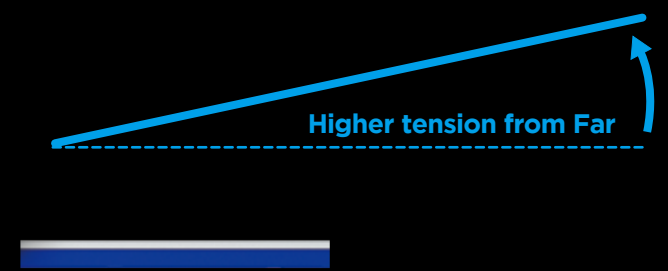

▶ **ILLEGAL BOOSTER**
Not Standardized

BUILT-IN TENSION
Under 55 Sponge

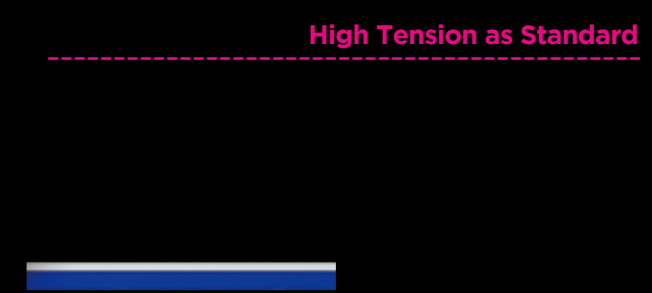

▶ **AI TECH**
Parameter Change

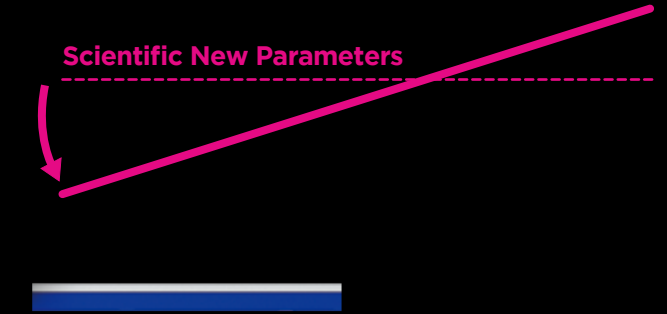

Classic sticky rubber uses the excessively hard sponge. Stiff and low tension helps the control for near-net play. But has the huge disadvantage in far-from-table play.

To compensate speed from far away, illegalized boosters are used to lower the stiffness. Control at net can be kept due to booster feature not reacting to low speed stroke.

Tension rubber with soft sponge has the elasticity already built in. Downside against its great speed from far away can be the lesser control at net play due to high tension.

AI introduced a new approach by aligning the pimple shape with the sponge thickness, creating the NIF sponge with ultra-slow elasticity.

THE PEOPLE'S RUBBER

Table tennis is a game that's easy to pick up but challenging to master. Since its launch in late 2009, VEGA has emerged as one of the world's most successful table tennis rubbers. It was engineered with the concept of "The People's Rubber" a design philosophy aimed at empowering every player, from the absolute beginner to the advanced competitor, to easily and confidently grow their skills. No matter your current level, VEGA is your ultimate partner for unlocking your full potential on the court.

NEW CHINESE STICKY RUBBER ENGINEERING

Chinese sticky rubbers are made with a sticky surface layer and extremely hard sponge. Sponge is too hard so that it cannot be used without applying the booster multiple times. Also it has the high defect rate due to the complexity of surface layer production to the level that consumers cannot find normal quality rubbers in the market. C-TOUCH made the hard sponge softer using built-in tension technology. New production process also scientifically reduced the defects in the application of a sticky layer.

STICKY RUBBER FOR ALL

CST Chinese Sticky Technology keeps the authentic Chinese rubber performance. Control with surface friction improves and the spin rotation increases at impact with CST. It makes the powerful topspin without the booster thanks to built-in TENSOR technology. Improved control at the net play and higher arc from mid-distance are the main advantages. Character is suitable for the player who wants to adopt Chinese rubber faster and easier.

TRADITIONAL CHINESE STICKY

The core advantage of a booster is from the increased mass of rubber to make more power and spin. Boosters usually enlarge the rubber over the regulated 4.0mm limit of rubber thickness. ITTF enforced the control over the rubber thickness by cancelling the win when the player's rubber measures over 4.05mm. On the contrary the new regulation based on thickness opened the freedom to use boosters under certain limit. NEO STICKY DYNAMICS rubbers are based on classic Chinese sticky rubber production. New production process minimized the defect rate successfully.

MICRO STICKY CHINESE HYBRID

HYBRID is a leading concept in contemporary table tennis. DYNA ELASTO evolved from classic Chinese sticky rubber has the micro sticky surface. Various spin attack from both far away and close-to-table empowers your game. Players can take the initiative in the rally with spin and play safer with higher arc. DYNA has an excellent offense & defense balance with reasonable soft sponge.

I A C T

Celebrating 50 years of innovation, XIOM proudly presents IACT, a revolutionary blade program designed to perfectly match your playing style, technique, and rubber combinations. It's a strategic tool crafted for your victory.

I INDEED - The Honest Truth of Speed and Power.

Based on extensive research into our ZLX material, INDEED is a high-speed, attacking blade designed for players who demand aggressive power. This is the blade that will truly unleash your true offensive potential.

^ ARTEMIS - The Balance of Grace and Power.

Named after the Greek goddess of the moon and hunt, ARTEMIS is a mystifyingly smooth yet powerful ALX blade. It delivers an outstanding balance of offense and defense, offering a soft touch for delicate play and a sudden burst of power when you need it most.

C CHROME - Spin and Control, the Ultimate Weapon.

A favorite among Chinese players, CHROME is a unique Inner Aramid blade for exceptional control and spin. It allows you to dominate rallies with precise ball placement and heavy spin, using your swing speed to amplify your finesse.

T TETRA - Heavy Impact, a Knockout Punch.

Featuring XIOM's exclusive TMX material, TETRA is a unique blend of three different layers that produces a heavy, high-energy ball. It's the ideal blade for players with a slower swing speed, giving you the power to create winning shots with overwhelming force.

I

I N D E E D
ZLX**ZEPHYLIUM CARBON ZLX**

A composite material made by weaving ZEPHYLIUM with carbon fibers. Lighter than ALX but higher elasticity.

PROS / Much higher repulsion and hardness than ALX. Explosive speed when hitting the ball and a wider sweet spot.

CONS / Less control than ALX simply due to higher repulsive power.

A

A R T E M I S
ALX**AXYLIUM CARBON ALX**

Composite material woven with soft AXYLIUM and carbon fibers. Capable of absorbing vibration appropriately.

PROS / Offers excellent feel and stable control in addition to the high speed of pure carbon. Perfect for all-around players who combine both offensive and defensive styles.

CONS / Lower repulsion compared to pure carbon.

C

C H R O M E
XAX**ARAMID CARBON XAX**

Combines the softness of Aramid fibers with the repulsion of carbon to provide a soft feel upon impact.

PROS / High Stability allowing for stable control when executing drives or spin techniques. Relatively softer feel excellent for enhancing your touch.

CONS / Slightly heavier weight and unique sound due to material properties.

T

T E T R A
TMX**TRIMETRIX TMX**

Hybrid fiber combined three different materials, designed to give a blade power, stability, and control all at once.

PROS / High stability beneficial for precisely controlling the ball during spin-heavy drives and serve returns. Explosive power during drive attacks thanks to the material's high elasticity.

CONS / Higher skill requirement.

OUTER BLADE

An outer blade has the composite material placed just below the surface ply. This construction maximizes the inherent performance of the composite. Outer blades are suitable for players who prioritize speed and direct power.

POWERFUL REBOUND AND SPEED / The composite is close to the surface, causing an immediate rebound upon ball contact. This makes it ideal for powerful, high-speed attacks.

SHARP FEEL / The hard feel of the surface is transmitted strongly, resulting in a very clear and sharp impact sensation.

LARGER SWEET SPOT / Even on off-center hits, the influence of the composite material maintains consistent rebound.

INNER BLADE

An inner blade places the composite material closer to the core, with an additional wood layer between the surface and the composite. The design combines the natural feel of wood with the benefits of the composite. More advantageous for tactical players.

SOFT FEEL AND SPIN / The ball stays on the surface a little longer, providing an excellent "gripping" sensation. This makes it easier to generate spin and offers more stable control.

HIGH CONTROL / The softer feel is well-suited for short-game techniques and precise control plays.

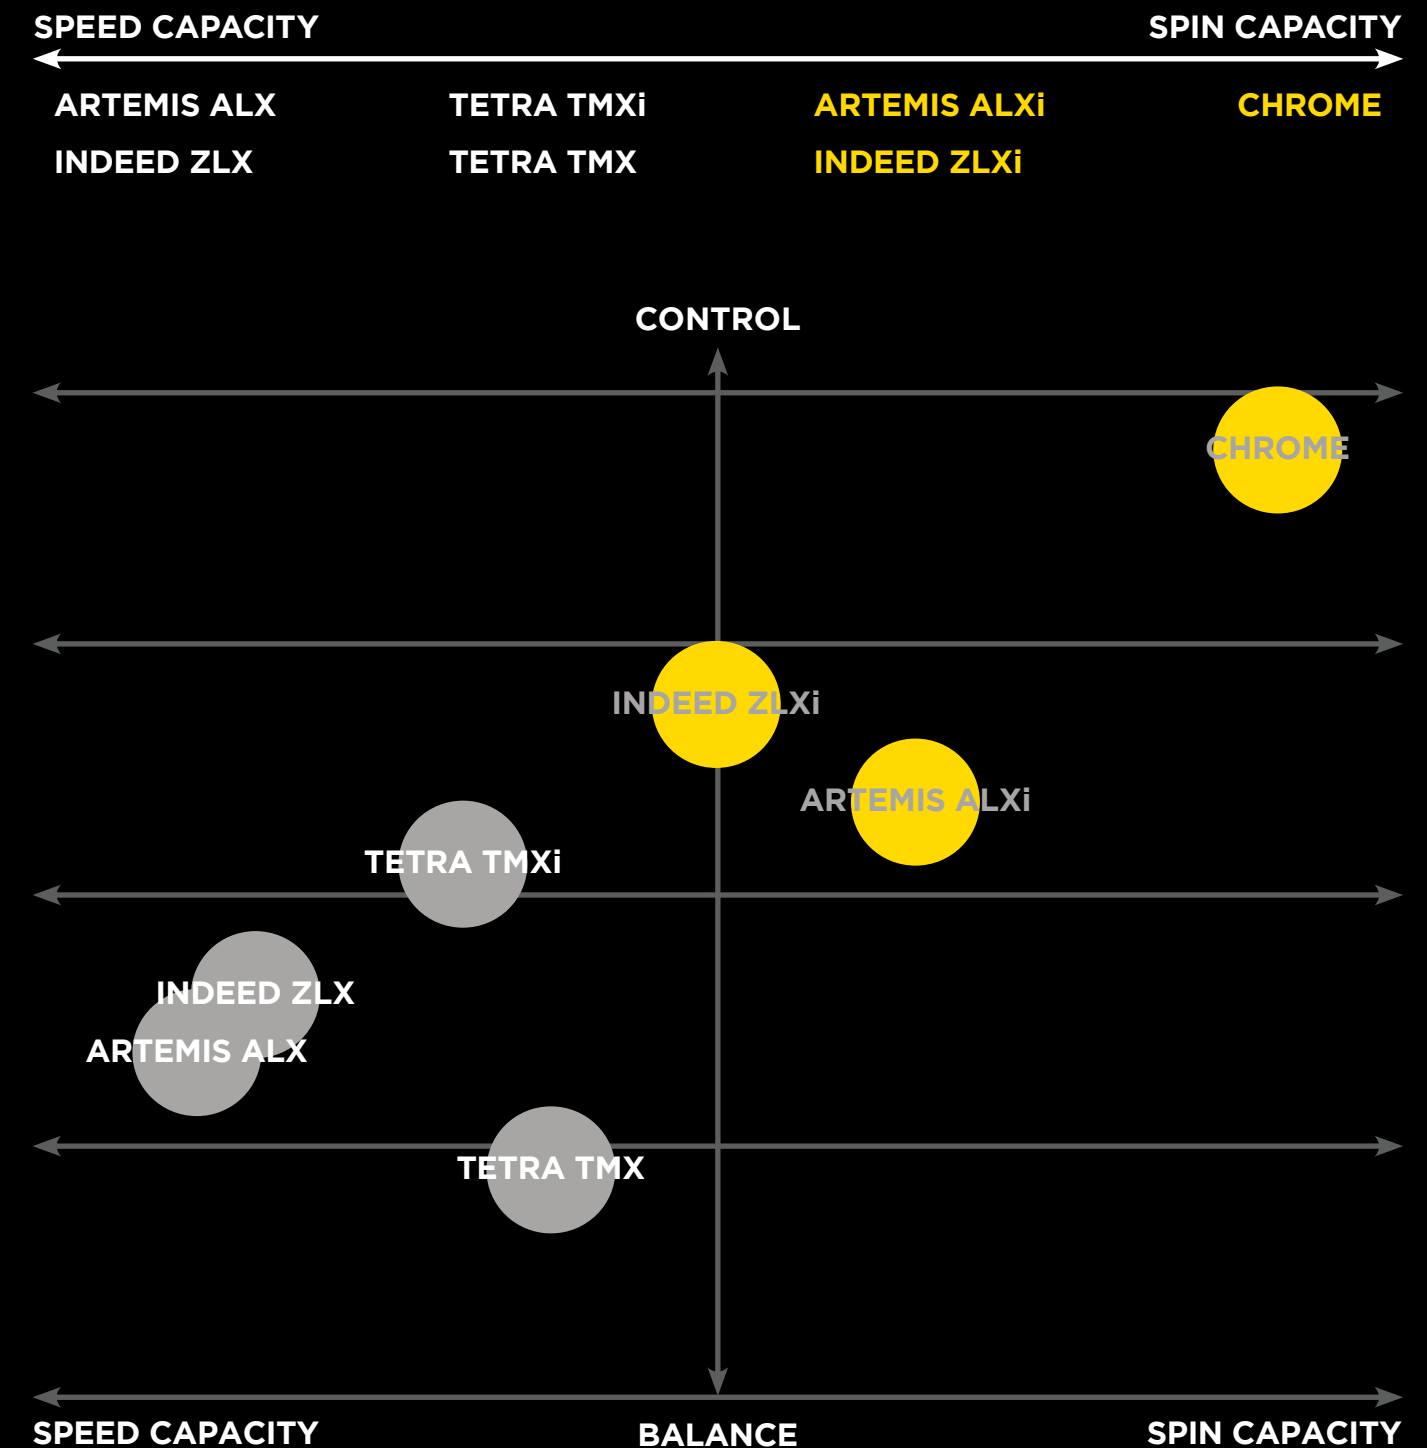

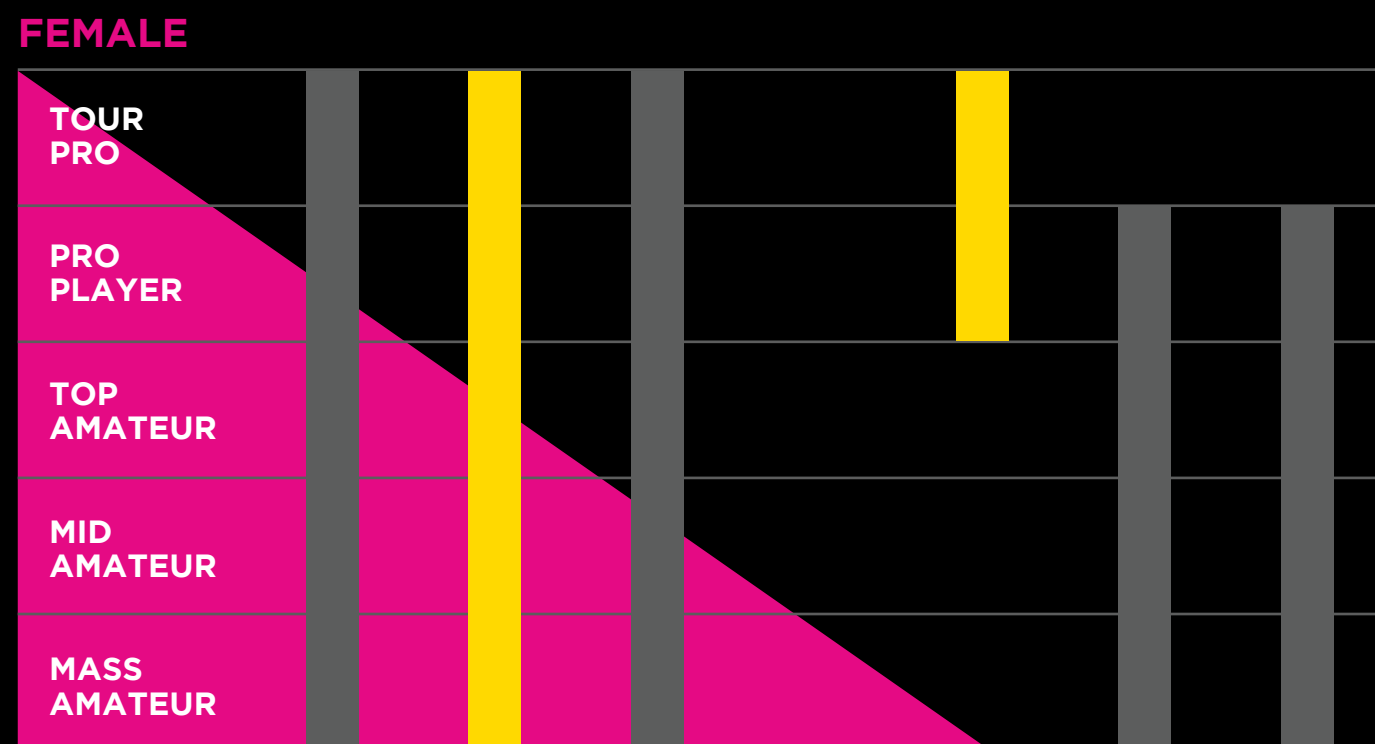

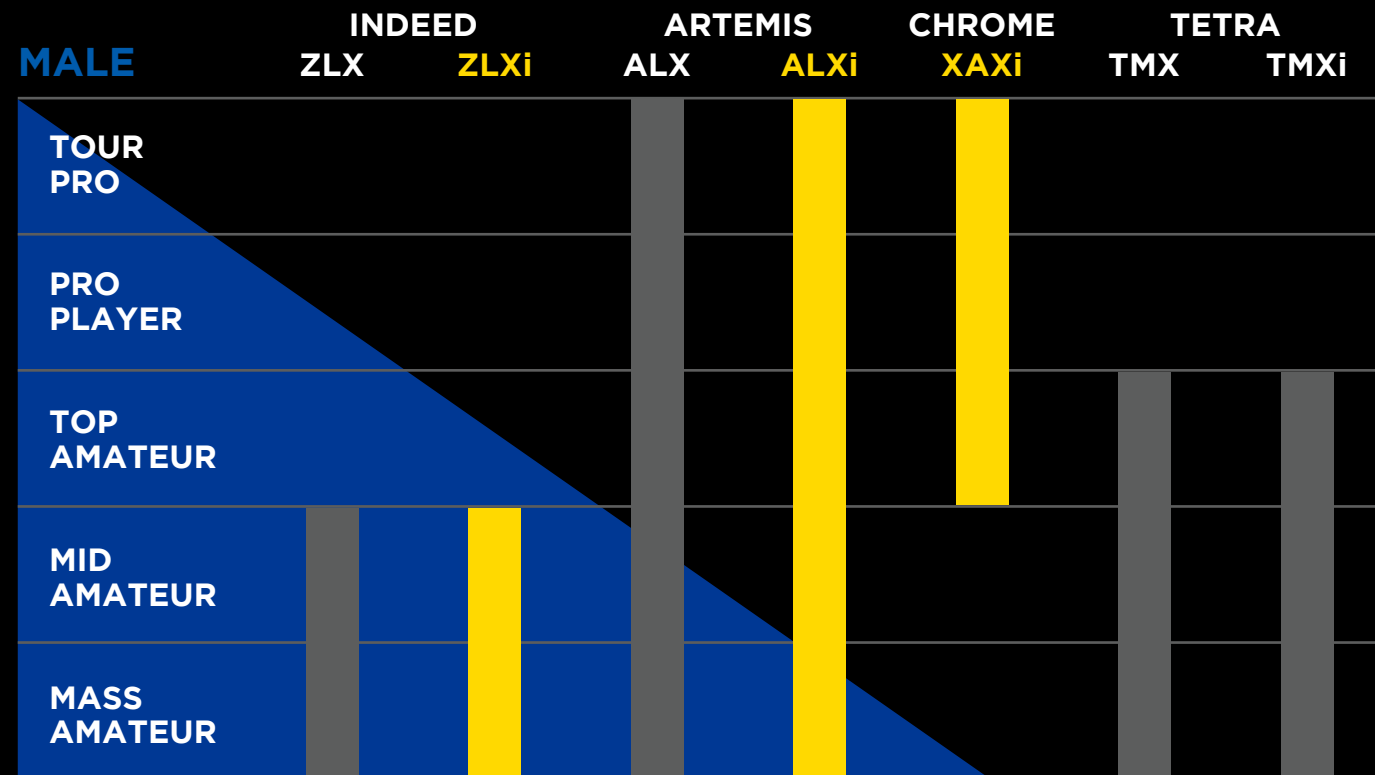

HIDDEN POWER / While light shots feel like an all-wood blade, a strong impact activates the inner carbon, allowing for powerful shots.

	8.5	8.6	9.0	8.6

PURE
CARBON

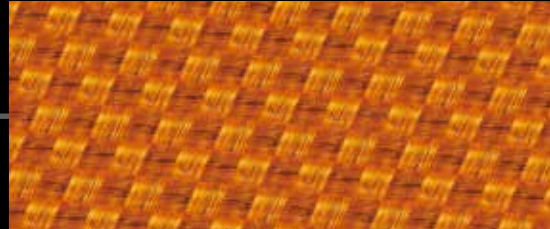

ZEPHYLIUM

Ultra-high-performance fiber with higher tensile strength and elasticity than Aramid. Very light-weight material providing powerful repulsion along with a unique and crispy hitting feel.

ZEPHYLIUM CARBON

ZEPHYLIUM's ultra-high-performance elasticity and lightness with carbon's powerful repulsion. It enables very crisp and fast shots, especially in powerful drives.

AXYLIUM

Fiber with properties similar to Aramid, excelling in vibration absorption and flexibility. Particularly good at holding the ball, which makes it ideal for stable control and executing various techniques.

AXYLIUM CARBON

Carbon's power combined with AXYLIUM's stable control for flexible hitting feel. For a stable playing style while providing the power needed for a decisive shot. For all-round players who balance both off/def.

ARAMID

High-performance fiber used in aircraft parts. Excellent vibration absorption and a good feeling of holding the ball. High elasticity to generate strong spin but lower repulsion than pure carbon.

ARAMID CARBON

Aramid's vibration absorption and stability with Carbon's repulsion. Vibrations absorbed by aramid and more spins by its bending character. Allows for powerful shots while feeling smoother than pure carbon.

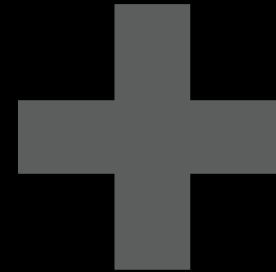

AXYLIUM

Combination of triple composite fibers with Pure Carbot, Zephylium, and Axylium.

ZEPHYLIUM

TRIMETRIX

TMX generates higher offensive power using catapult. With a new weaving method ZEPHYLIUM and AXYLIUM combined with Carbon. Combination of high elasticity, stability, and power for innovation.

LIMBA

Primarily used for the top ply of a blade. Softer than Koto and provides high ball-gripping ability. Blades using Limba are suitable for spin techniques in close-to-the-table and mid-distance play, offering both a good amount of rebound and control.

AYOUS

Most commonly used for the core or 2nd ply. It's lightweight and elastic, helping to reduce the overall weight while maintaining sufficient rebound. When combined with various other woods, it balances the blade's speed, spin, and control.

KOTO

Excellent surface wood for outer composite blade with its sharpness for intuitively hit feel. Koto is harder than Limba and gives a sharp feel upon impact. It provides high ball speed and excellent control, making it suitable for players who prefer fast attacks. It's advantageous for aggressive, close-to-the-table play.

HINOKI

Hinoki is soft yet boasts powerful rebound and excellent feel. It's commonly used for single-ply blades, and its soft feel helps hold the ball, making it very effective for drive attacks.

KIRI

Very light and soft wood, primarily used for the core ply. Effective at lowering the overall weight and has shock-absorbing properties. Especially useful when paired with composite like carbon, as it complements rebound while increasing stability.

HIGH REPULSION / Carbon fibers are very rigid and elastic, transferring powerful energy to the ball.
REDUCED FEEL / Pure carbon blades can have a "dead" or "unnatural" feel; reduced "holding".

LSS LITE

WORLD YOUTH CHAMPION

ALX LITE

	5+2	5.8	157 150	FL ST	KOREA
	PLY	MM	HEAD	GRIP	ORIGIN

Light Version - Outer Axylium Carbon
While keeping the unique characteristics of ALX, this blade relieves the burden of heavy weight to enhance swing speed.

189.90 €	CATAPULT	BALL GRAB	REPULSION	PRECISION
	8.2	8.2	9.1	8.5

STRADIVARIUS *f*

SENSE ENGINEERING & ENERGY EFFICIENCY

A table tennis racket is not just a tool. It is an extension of the player's hand. Energy efficiency is the key factor that determines how effectively the racket transfers power to the ball. If you need delicate control and a precise feel beyond just hitting hard, you must choose a blade with a high tactile feedback index. Instead of forcing the ball away, STRADIVARIUS reduces the energy loss and puts only the necessary force onto the ball. STRADIVARIUS blade provides an excellent "holding" feel, giving you the delicate sensation for stable returns at your fingertips. There are many blades with good repulsion. But a true master dominates the feel of the ball.

HAYABUSA

IMPACT TRANSFER

All vibration patterns are interacting to make a unique character. IMPACT TRANSFER is the core of blade properties for speed and feel. Vivrotech was to explain the blade in real-life table tennis. As a conclusion the behavior of blade only at high speed determines the real performance. Captive is about grabbing/dwelling feel of a ball at impact and Repulsion about instant rebounding speed. HAYABUSA focused on captive at high speed impact. Blade captures a ball deeply into the skin and katapulting back in energy.

**Kiso
Hinoki**

KING OF WOODS

Kiso Hinoki is recognized as the undisputed "King of Woods". The most famous Hinoki trees grow in Kiso area which has the unique weather condition. Weather makes the Kiso Hinoki to have very high elasticity per weight. Among 250~350 years old Kiso Hinoki lumbers, only 20-30% meet the quality for table tennis blade. Hinoki wood makes an amazing speed and also delivers extremely clear/direct vibrations. dHinoki monoply penholder blade has the extremely powerful catapult and speed. Energy efficiency is at the top level among different woods for table tennis.

T NOVUS

WOOD PLY ENGINEERING

NOVUS was designed in dynamics to minimize the energy lose by deformation and damping effect at the ball contact. But blade construction was also built focusing on saving vibrations for "TOUCH FEEL" that a blade makes direct and clear feel to your hand at the impact.

AXELO

	3+2	7.6	158 150	FL ST	CHINA
	PLY	MM	HEAD	GRIP	ORIGIN

Strongest Repulsion & Destructive Energy

BOUNDPRO

RESILIENT 4-LAYER FOR LIFETIME USE & OUTDOOR
Crafted in Italy with a four-layer precision finish. Made with German high-density special PB, ensuring rebound, uniformity, and spin accuracy.

micro SURFACE

Conical Particle for Consistent Spin
Overlay surface has cone-shaped structure. Moulded particle shape for consistent spin.

evCORLINE

Permanent Line Below the Overlay
Line printed below top layer cannot be erased. Line print on paper beneath the polymer cover.

EDGE

Precision Banding for Perfect 90°
High-density board with precise edge banding. Ensures the side angles remain durable over time.

SPINPRO

micro SURFACE

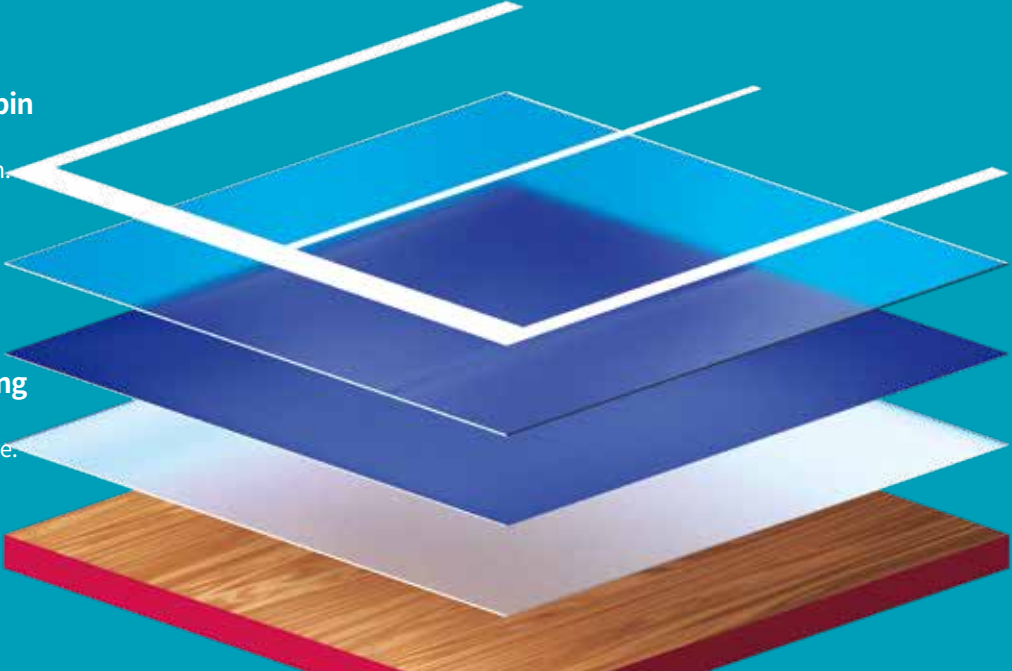

Egg Shaped Surface Paricle for Spin
UV surface has egg-shaped structure. Smaller particles for precise spin reflection.

UVC

High Quality Surface by UV Coating
Hardened by Ultraviolet rays for quality. Regular bounds and more visible ball-move.

EDGE

Precision Banding for Perfect 90°
High density MDF and precise edge banding. Side angle cannot wear out over long time.

HIGH QUALITY UV-COATED 3 LAYER SURFACE
Highest spin-reflection precision at rebound. Regular bounds over all area and longer lifetime. Thickest MDF and melamine surface for quality.

PRO SERIES ITTF

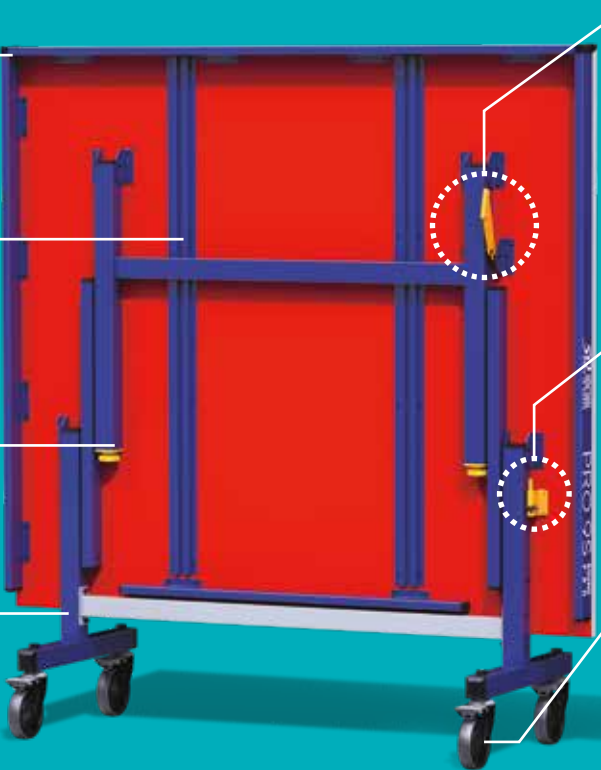

25mm

60mm Frame
Anti-bending frame for stability of table.

Back Muscle
Steel Support for Regular Bounding.

50mm H Leg
Front leg to hold the heavy table top.

50mm T Leg for Large Casters
Extra strong caster leg for large size casters.

Fixing Wedge
A locking mechanism to prevent wobbling of the table when set up. Press to lock when open, and release when folding.

Semi Auto Lock
Safety lock to hold the table in stand position. Should release with hands to open the table.

Anti-Noise Plastic 5" Caster
Large casters made of hard plastic for stability.
